

The Revolution of Ecodesign NATURALLY tailored to all styles

Life-cycle assessment, applying ISO standards 14040-14044 and CML-2001 and Eco-indicator methods

Minimum environmental impact

Use of 100% recyclable material

We have used the most up-to-date ECODESIGN methods available on the market for the new MP CARevolution passenger car, right from the conceptual design phase.

For this purpose, a rigorous and detailed **life-cycle assessment** has been done, applying **ISO standards 14040-14044** (in its compulsory phase) and methods CML-2001 and Eco-indicator 99 (in its optional phases).

The result of this process is a product with **minimum environmental impact**, this being supported by the use of **materials which completely respect the environment** and are **100% recyclable**, the optimisation and simplification of manufacturing processes, the use of highly efficient lighting and signalling technology and a significant optimisation in terms of its weight, this directly bringing about a reduction in energy consumption by the lift over its service life.

Eco-efficient design tailored to your needs
